DIVISION OF FISH AND WILDLIFE
STREAM ASSESSMENT REPORT

Report Date: February 2, 2012

| Region | Area | Stream Name | Tributary No. | Stream Length |
|---------|-----------|---------------------|------------------|-----------------|
| 3 | Lake City | Cold Spring Brook | M-34-48 | 2.2 miles |
| County | | Watershed Name, No. | Source (T, R, S) | Mouth (T, R, S) |
| Wabasha | | Zumbro River-41 | T110N.R14W.S25 | T110N.R14W.S36 |

Date(s) of Assessment: September 29, 2011

Assessment Purpose: Long Term Monitoring

| Station | Similar Reach | Stream Mile | Length (ft) | Mean Width (ft) | Acres | Water Temp (°F) | Air Temp (°F) | Downstream UTM's | |
|---------|---------------|-------------|-------------|-----------------|-------|-----------------|---------------|----------------------|----------------------|
| | | | | | | | | utm _x (↔) | utm _y (↕) |
| 0.5 | 1 | 0.5 | 1170 | 25 | 0.67 | | | 545185 | 4904438 |

Summary:

Station 0.5 on Cold Spring Brook is one of the Long-Term Monitoring stations in Southeastern Minnesota. This station has been sampled annually in the fall since 1998 as part of the LTM program.

Estimates were obtained using a two pass depletion method using a stream shocking barge.

The brown trout population had an estimated 444 adults/mile and 519 recruits/mile. There were an estimated 118 brown trout \geq 12 inches, 74 \geq 14 inches, and 18 \geq 16 inches per mile.

The brook trout population had an estimated 78 adults/mile and 554 recruits/mile. There were no brook trout \geq 10 inches sampled.

There were no white suckers sampled in Cold Spring Brook in this survey.

Two tiger trout were sampled. There were no other species sampled in this survey.

Discussion of Fishery:

Station 0.5 on Cold Spring Brook is one of the stations in the Long-Term Monitoring program in southeastern Minnesota. This station has been sampled annually since the fall of 1998 to assess the brown and brook trout populations (Table 1 & 2).

In the fall of 2011, the brown trout population was estimated at 444 adults/mile, lower than the 13 year mean of 1,184/mile and less than the amount in 2010 of 711/mile (Table 1). The estimated number of recruits was 519/mile, lower than the 13-year mean of 1,925/mile and lower than the amount in 2010 which was 689/mile (Table 1). There was an estimated 118 brown trout/mile ≥ 12 inches, 74/mile ≥ 14 inches, and 18/mile ≥ 16 inches. All of these values decreased from 2010. (Table 1). The biomass of brown trout was 97.8 lbs/acre which is lower than the 13-year mean of 185.3 lbs/acre (Table 1).

The estimated number of adult brook trout was 78/mile (Table 2). This is lower than the 13 year fall mean of 349/mile and lower than the 2010 value of 191/mile (Table 2). The brook trout population had an estimated 554 recruits/mile which is lower than the 13-year mean of 979/mile and lower than the estimate in 2010 of 994/mile (Table 2). There were no brook trout ≥ 10 inches found in this survey. This is the first survey with no brook trout over ten inches. (Table 2). Brook trout biomass was 12.9 lbs/acre which is lower than the 2010 value of 24.67 lbs/acre (Table 2).

There were no white suckers found in this survey which is common for this stream.

The Coldwater Index of Biotic Integrity (Mundahl and Simon 1998) score has been variable over the last three years. A score of 105 was recorded in 2009 and decreased to 70 in 2010, but rebounded to 105 in 2011.(Table 3). This may be the result of significant flood events that have occurred during this time period.

In 2011, the Minnesota Stream Habitat Assessment (MSHA) score was 63.35, lower than the 2010 value of 70.15 (Table 3). The stream is characterized by minimal bank erosion but the recent flood added stress to banks. Shade, in stream cover, channel stability, and sinuosity are moderate. The stream is also moderately embedded. Cold Spring Brook has good channel development with a good pool; riffle dynamic. A habitat improvement project is scheduled to begin in 2011.

Discussion of Fishery:

Station 0.5 on Cold Spring Brook is one of the stations in the Long-Term Monitoring program in southeastern Minnesota. This station has been sampled annually since the fall of 1998 to assess the brown and brook trout populations (Table 1 & 2).

In the fall of 2011, the brown trout population was estimated at 444 adults/mile, lower than the 13 year mean of 1,184/mile and less than the amount in 2010 of 711/mile (Table 1). The estimated number of recruits was 519/mile, lower than the 13-year mean of 1,925/mile and lower than the amount in 2010 which was 689/mile (Table 1). There was an estimated 118 brown trout/mile ≥ 12 inches, 74/mile ≥ 14 inches, and 18/mile ≥ 16 inches. All of these values decreased from 2010. (Table 1). The biomass of brown trout was 97.8 lbs/acre which is lower than the 13-year mean of 185.3 lbs/acre (Table 1).

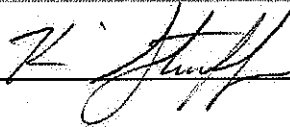

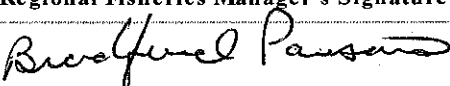

The estimated number of adult brook trout was 78/mile (Table 2). This is lower than the 13 year fall mean of 349/mile and lower than the 2010 value of 191/mile (Table 2). The brook trout population had an estimated 554 recruits/mile which is lower than the 13-year mean of 979/mile and lower than the estimate in 2010 of 994/mile (Table 2). There were no brook trout ≥ 10 inches found in this survey. This is the first survey with no brook trout over ten inches. (Table 2). Brook trout biomass was 12.9 lbs/acre which is lower than the 2010 value of 24.67 lbs/acre (Table 2).

There were no white suckers found in this survey which is common for this stream.

The Coldwater Index of Biotic Integrity (Mundahl and Simon 1998) score has been variable over the last three years. A score of 105 was recorded in 2009 and decreased to 70 in 2010, but rebounded to 105 in 2011.(Table 3). This may be the result of significant flood events that have occurred during this time period.

In 2011, the Minnesota Stream Habitat Assessment (MSHA) score was 63.35, lower than the 2010 value of 70.15 (Table 3). The stream is characterized by minimal bank erosion but the recent flood added stress to banks. Shade, in stream cover, channel stability, and sinuosity are moderate. The stream is also moderately embedded. Cold Spring Brook has good channel development with a good pool; riffle dynamic. A habitat improvement project is scheduled to begin in 2011.
